How Can Health Reform Be Made Better?	47

What Are the Facts?

During the nine-month period leading up to the passage of the Patient Protection and Affordable Care Act, Americans were subjected to more than \$200 million worth of TV, radio, newsprint and Internet ads. Almost all of these — pro and the con — were pure propaganda.

Even today, the White House and leaders of both political parties offer us little more than sound bites crafted for the evening news. A <u>taxpayer-funded mailing</u> to Medicare enrollees has been accused of selling more than informing. The <u>government's own Web site</u>, while containing much valuable information, touts only the *benefits* of reform and ignores the *costs*. It focuses on what *might go right* and ignores what *might go wrong*.

As a result, many people are rightly confused about what to expect and why. We hope this publication will clear the air. Its goal is a balanced overview, with all important content sourced from government reports and other reputable documents.

Overview: A Better Health Care System?

Recently <u>enacted legislation</u> will radically transform the U.S. health care system. These changes will occur over time, however. The most significant changes (e.g., a requirement that most people obtain health insurance) will not become law until 2014. A tax on employee "Cadillac" health plans does not take effect until 2019. This means there will be many elections and many opportunities for voters to express their will before most provisions become law. In the meantime, here is a brief summary.

Structural Features of Reform

- Beginning in 2014, you will be required by law to have health insurance and to attach proof of insurance to your tax return.
- If you fail to insure, you will be fined with the penalty rising to \$695 (\$2,085 per family) in 2016 or 2.5% of your adjusted gross income, whichever is greater.
- If your employer fails to offer you health insurance, your employer can be fined as much as \$2,000 per employee per year.
- The type of insurance you must have including copays, deductibles and the employee's share of the premium will all be determined by federal regulations, rather than by you and your employer.
- If you are not covered by an employer plan, Medicare, Medicaid or other government plan, you will be required to buy insurance in a government-regulated health insurance

exchange, where competing insurers will offer the government-mandated health insurance benefit package.

• How your doctor practices medicine and how you obtain care are likely to substantially change.

Some Major Benefits of the Reform. Some of the touted benefits of reform are not new. For example, since 1996 federal law has barred insurers from dropping your coverage just because you get sick. However, the following changes are new:

- You may be able to buy insurance you cannot now afford. Beginning in 2014, for example, a couple with an income of twice the poverty level (currently \$29,000) will be able to buy insurance for an annual premium no higher than 6.3% of their income (\$1,827).
- If you have a pre-existing condition, you will be able to buy insurance for the same premium as that paid by people in good health.
- Over the next four years, newly created risk pools will offer subsidized insurance to some of the people who have been turned down by health insurers because of a pre-existing condition.
- If you have a very expensive and continuing health problem, there will be no lifetime limits on your health insurance coverage.
- Overall, the <u>Congressional Budget Office</u> (CBO) expects 32 million otherwise uninsured people (about 60% of the total) to obtain health insurance. <u>Medicare's chief actuary</u> puts the estimate at 34 million.

Some Major Costs of the Reform. In general, for every benefit there is an offsetting cost. More than half the costs of this reform, for example, will be borne by the elderly and disabled on Medicare:

- \$523 billion of health reform's first 10-year cost will be paid for by cuts in spending on Medicare enrollees, according to <u>Congressional Budget Office</u>.
- In addition, there are new taxes on drugs and on such medical devices as wheelchairs, crutches, pacemakers, artificial joints, etc. — items disproportionately used by Medicare enrollees.

Reduced spending and reduced subsidies will have an especially big impact on seniors:

 Of the 15 million people expected to enroll in Medicare Advantage programs, 7½ million will lose their plans entirely, according to Medicare's chief actuary, and the remainder will face <u>higher premiums and lower benefits</u>. • Nearly 6 million retired employees will lose their employer drug coverage, according to the most recent Medicare Trustees report.

There are other measures that will affect the more general population:

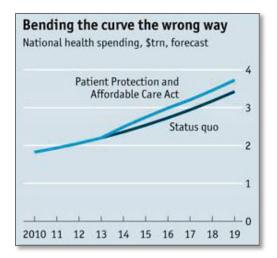

- A new tax on health insurance is likely to cost the families of employees of small businesses more than <u>\$500 a year in higher premiums</u>.
- A 40% tax on the extra coverage provided by expensive "Cadillac" plans will apply to about one-third of all private health insurance in 2019; and because the tax threshold is not indexed to medical inflation, over time the tax will eventually reach every health plan.
- Scores of other items will be taxed, ranging from tanning salons to the sale of your home, in some cases.

There are also hidden costs of certain benefits:

- Health insurers will have to raise premiums for everyone in order to charge people with pre-existing conditions less than the expected cost of their care. Young people, for example, could see a doubling or tripling of their premiums, according to <u>industry</u> <u>estimates</u>.
- In order for employers to provide health insurance (or more generous insurance) to their employees, they will have to reduce what they pay in wages and in other benefits.
- The extra burden on employers could cost as many as 700,000 jobs by 2019.

What Health Reform Does Not Do. During the debate leading up to health reform legislation, participants discussed many problems and many goals. Here are some goals that will not be achieved:

Health care costs may rise, rather than fall. Although the CBO initially predicted a slight lowering of overall health care costs in future years, <u>it is now expressing doubts</u>. <u>Medicare's chief actuary</u> and most private forecasts expect overall costs as well as the government's costs to be higher than otherwise. The graph below shows the prediction of the <u>RAND Corporation</u>, a respected private think tank.

One of the great uncertainties in this regard is whether the federal government will actually follow through on cuts in Medicare spending in future years — as called for under the new law. As a <u>report from Medicare's actuaries</u> explains:

- Under the law, Medicare fees paid to doctors are required to drop by 30% in the next three years.
- Medicare fees paid to doctors and hospitals will fall below Medicaid levels by 2019 and going forward will fall increasingly behind the rates paid by other patients.
- By 2050, Medicare fees are projected to be only one-half of what the private sector pays.
- By 2080, they will be only one-third.

Health economist <u>Joe Newhouse explains</u> what will happen if we follow this projected path:

- Medicare fees paid to doctors and hospitals will fall increasingly behind what private insurers are paying.
- As a result, seniors and the disabled will have increasingly less access to care, as providers tend first to the better-paying patients.
- In the near future, the fate of Medicare patients would come to resemble that of today's Medicaid enrollees, or even worse with seniors and the disabled having to seek care at community health centers and safety net hospitals.

Will future Congresses and future presidents actually allow this to happen? The current Congress and the current president have certainly committed to it. But other actions suggest that their commitment may be weak. For example, current federal law is supposed to limit Medicare fee increases to doctors to no more than the rate of growth of national income. But for the past seven years <u>Congress has stepped in</u> to prevent these limits from being imposed.

Health insurance will not become portable for most people. The vast majority of people with private health insurance will continue to get job-based insurance. This means that when you leave your job — because of, say, a layoff or retirement — you will lose your coverage and be forced to find new insurance elsewhere.

People with the same incomes will not be treated the same under the tax law. One of the complaints about the current system is that while employer-provided health insurance may be purchased with pretax dollars, people who buy insurance on their own must pay with after-tax dollars. In fact, the <u>after-tax cost of insurance</u> for middle-

class families who purchase their own insurance can be twice as high as it is if they get insurance at work! This inequity will not only continue under health reform, a new system of subsidies will create new inequities.

Access to care may become more difficult for some patients. Health economists estimate that people with health insurance <u>consume twice as much health care</u> as people without it. This means that as many as 34 million newly insured people will probably try to double their use of health care resources. Millions of others will be required to obtain insurance that is more generous than what they now have, and the more generous coverage will induce them to try to obtain more care.

The result: The demand for medical care is likely to greatly exceed the supply. Although there is disagreement about the size of the coming physician shortage, <u>Medicare's chief actuary</u> and some <u>private sector economists</u> are predicting major problems in access to care, including increased waiting. In Massachusetts, with a similar health reform:

- New patients in Boston wait an average of 63 days to see a family doctor.
- There are <u>more people going to hospital emergency rooms</u> for nonemergency care in Massachusetts today than there were before that state's health reform was enacted.

The quality of care may fall, rather than rise, for some patients. To address the problem of quality, the new law authorizes "pilot" demonstration projects, funds research to discover "best practices," and gives Medicare new powers to try to force doctors and hospitals to change how they practice medicine. Serious scholars are skeptical of how well this will work. In the meantime, new problems will arise as doctors try to deal with a surge in demand for their services. In Britain, Canada and other developed countries, doctors often deal with these problems by reducing the amount of time they spend with each patient.

The Role of Government. By far the most significant change in health reform will be the new role of government. You, your family and your employer will no longer be able to make many of the decisions you have been making on your own. Instead, the power to make those decisions will be shifted to 159 new federal agencies, exerting unprecedented control over almost one-sixth of the economy. Moreover, extraordinary discretionary power is being delegated to the Secretary of the Department of Health and Human Services. The two acts creating health reform, for example, delegate powers through the term "the Secretary shall" 1,075 times.

More mandated benefits. Under the current system, most employees have health insurance that is exempt from state regulation and is subject to very few federal regulations. For most people, this is a blessing. Health insurance regulated by state

government is often burdened by cost-increasing mandated benefits. These include requirements to cover providers ranging from marriage counselors to naturopaths, services ranging from acupuncture to in vitro fertilization and even requirements to cover contraceptives without any deductible or copayment. By some estimates as many as one in four uninsured people have been priced out of the market for insurance because of the high premiums these regulations lead to.

Under the new law, all insurance that is not "grandfathered" will have to have benefits determined by the federal government. This will give interest groups that have successfully lobbied at the state level the opportunity to lobby at the national level for inclusion in the insurance package everyone has to buy.

Less patient power. Employers will not be able to let employees make many decisions they are making today. For example, there is <u>considerable controversy</u> over who should get mammograms, Pap smears, prostate cancer tests and other procedures — and at what age and how often. Instead of dictating a one-solution-for-everyone approach, some employers put money in a savings account for their employees and let the employees make their own buying decisions. Under the new law, that will no longer be possible. Who is eligible for what test and when will be determined by the federal government.

Less freedom of medical practice. The federal government will conduct extensive "comparative effectiveness research," evaluating what works, what doesn't work and what's worthwhile. A similar agency in Britain gives local health authorities "cover" to <u>deny patients such care as cancer drugs</u> that are routinely available in the United States and Europe. Critics worry the same could happen here.

Where Will I Get My Health Insurance?

You may get it the same place you get it today — through an employer, or through Medicare or Medicaid, or through a Medicare or Medicaid contractor (e.g., a Medicare Advantage plan).

If you buy your own insurance, however, you will have to obtain it through a "health insurance exchange" in which competing insurers will offer government-mandated packages of benefits. States may have flexibility in how the exchanges operate. You may be able to obtain insurance online, for example.

If your income is below 133% of the poverty level (currently \$14,404 for an individual and \$29,326 for a family of four), however, you will be required to enroll in Medicaid and you will not be allowed access to the exchange.

Will I Be Able to Keep the Insurance I Now Have?

Possibly not.

Your Employer May Be Forced to Switch to Another Plan. In general, if employers make very few changes to their current plan, that plan will be "grandfathered," in keeping with President Obama's promise that, "If you like the plan you are in, you can keep it." But most plans will be unable to qualify for grandfather status. A <u>government memorandum</u> predicts that:

- More than half of all employees with employer-provided health insurance will have to switch to a more expensive, more regulated plan and the number may be as high as two-thirds.
- Among those who will be required to switch plans are as many as 80% of employees in small businesses.
- Within three years, more than *100 million people* will be forced into a health plan more costly and more regulated than the one they have today.
- Moreover, grandfathering is only a temporary phenomenon. The memorandum suggests that eventually all plans will lose their grandfather status.

Your Employer May Drop Coverage Altogether. Most employers will be required to provide health insurance or pay a fine. But since the fine will be as little as one-seventh the cost of insuring you and your family, many employers — especially small employers — may drop their coverage altogether. This will force you and other employees to go to a "health insurance exchange" for your health insurance. This is already happening in Massachusetts with a similar health reform law, and the reaction is likely to be more pronounced in other states. Overall:

- The <u>Congressional Budget Office</u> estimates that 9 million employees will lose their employer plan.
- <u>Medicare's chief actuary</u> estimates that 14 million employees will lose the coverage they now have and, of those, about 2 million will enroll in Medicaid.
- A <u>former CBO director</u> is predicting a much larger employer response, with 35 million employees losing their current coverage.

Loss of Medicare Advantage Coverage. About half of the enrollees in Medicare Advantage (MA) plans (7½ million people) are <u>likely to lose their coverage</u> and will be forced to return to conventional Medicare. If you are able to keep your MA plan, expect higher premiums and fewer benefits.

Loss of Postretirement Coverage. If you are a retiree and your previous employer has supplemental insurance that pays the cost of your drugs, you are unlikely to be able to keep your plan. Under current law, employers receive a direct subsidy plus a tax subsidy if they provide Medicare Part D benefits that the government would otherwise have to pay for. The health reform law removes the tax subsidy, however. As a result, almost all retirees with employer coverage for prescription drugs (5.8 million out of 6.6 million) are expected to eventually lose it, according to the latest Medicare Trustees report.

How Much Will Health Insurance Cost?

Unless you qualify for an exception, beginning in 2014, the new law will require you to obtain a health insurance plan. Although the exact features of this insurance have yet to be determined (the Secretary of Health and Human Services (HHS) has a lot of discretion in this regard), the benefits will be mandated under federal law. In all likelihood, this new mandatory coverage will be more extensive and more costly than the insurance you currently have. The typical coverage for a family of four in 2016, for example, will average about \$5,800 (individual) and \$15,000 (for a family of four), according to the <u>Congressional Budget Office</u>.

Your Share of the Cost in the Exchange. The out-of-pocket premium you will have to pay will be no more than 3% of your income for someone at the poverty level (currently \$14,404 for an individual and \$29,327 for a family of four), rising to 9.5% of income at 400% of poverty (currently \$43,320 for an individual and \$88,200 for a family). However, if you earn above that level, you will have to pay the full premium yourself.

Your Share of the Premium at Work. If your income is less than 400% of poverty, your share of the premium will be limited to no more than 9.5% of your income. There is a big difference between the limits in the exchange and the limits at work, however. In the exchange, your share of the premium will be kept low by a refundable tax credit — a gift from the government that will pay the remaining premium expenses. But there will not be any new subsidies for employer coverage. So if your employer is required to reduce the amount of the premium you pay at work, the extra cost to your employer will have to be made up by reducing other compensation (cash wages and other benefits). In the exchange, someone else (the government) pays to keep your premium low, but at work it's likely that you will pay.

Unequal Subsidies. As the table below shows, you will get very different subsidies from the government depending on your income and where you acquire health insurance. In general, the new system is much more generous to lower-income families if they obtain insurance in the exchange and is much more generous to higher-income families if they obtain insurance at work. Some of these differences appear very strange:

- A family earning \$30,000 per year will get a \$19,400 subsidy (covering most of the premium plus most out-of-pocket expenses) if purchasing coverage in the exchange, but only a \$2,811 subsidy for coverage through an employer.
- A family earning \$60,000 per year will get \$12,400 if purchasing coverage in the exchange, more than four times the subsidy available to a family with half as much income getting insurance at work.
- A family earning \$90,100 per year will get \$3,900 if purchasing coverage in the exchange, nearly 40% more than the subsidy available to a family earning one-third as much and getting insurance at work.

Income (AGI)	Subsidy In the Exchange	Subsidy <u>at Work</u>
\$ 30,000	\$19,400	\$2,811
42,000	17,400	3,921
54,000	14,300	4,497
66,000	10,500	4,796
78,000	6,700	4,661
90,100	3,900	4,545
102,100	0	4,545

Health Reform Tax Subsidies in 2016

Sources: <u>National Center for Policy Analysis</u>/ Congressional Budget Office/Joint Tax Committee

Increases in Costs Over Time. A big problem with health reform is that you will be forced to buy insurance, the cost of which is going to grow faster than your income. In fact, if we stay on the path we have been on for the past 40 years, health care costs (and, therefore, premiums) will rise at twice the rate of growth of our incomes.

Limited Ability to Control Costs. In the past, individuals and their employers have done a number of things to try to control their health insurance costs. These include higher deductibles (letting you manage your own small-dollar expenses), more limited benefits or even a shift to catastrophic-only insurance. However, many of these responses will no longer be allowed under the new reform law. Out-of-pocket spending (on covered items) is limited, for example, and preventive services must be available with no deductible or copayment.

What If I Have to Buy Insurance in a Health Insurance Exchange?

A health insurance exchange is an artificial market where insurance plans compete for customers, usually during an annual enrollment period called an "open season." Federal employees, for example, get their health insurance this way. The federal government pays about 75% of the cost and the employees pay the other 25%. The employees can typically choose among a dozen or so plans. Many employees of state and local government, including many public colleges and universities, also participate in health insurance exchanges. In addition, two states (Massachusetts and Utah) have established exchanges for broad-based populations. The one in Massachusetts is said to be the model upon which the new federal health reform law is based.

Unlike the system for federal employees, however, in the state-based exchanges to be created under health reform every insurer will have to offer the same basic package of benefits, although they may differ in how those benefits are obtained. For example, some plans may be Health Maintenance Organizations (HMOs), while others have provider networks. Plans may also differ with respect to deductibles and copayments.

Attractive Features of Exchanges. Competition and choice must rank high on the list of favorable features. Plans are forced to charge everyone at the same age the same premium, regardless of health status. Also, when all the employees in the exchange work for the same employer (e.g., federal employees) the employer acts as a "regulator" of sorts — solving problems and making sure the insurance companies abide by the rules of the exchange.

Unattractive Features of Exchanges. Offsetting these benefits are some negative features:

Opportunities for people to game the system. Federal and state employee exchanges cater to self-contained groups. Employees rarely ever go outside of the exchange (because they can't use their employer subsidy on the outside) and outsiders (nonemployees) can't get in. In a system-wide exchange (like Massachusetts), however, people have perverse incentives to game the system. They can remain uninsured while they are healthy (paying a small fine perhaps) then enroll in a health plan after they get sick, get their health care, get their medical bills paid, and drop their coverage after they get well. This opportunity to game the system, which is becoming a <u>major problem in</u> <u>Massachusetts</u>, raises the costs and makes insurance very expensive for everyone.

Opportunities for insurance companies to game the system. Since every buyer in the exchange pays the same premium (regardless of expected cost), insurers have perverse incentives to attract the healthy and avoid the sick — much more so than under the current system. Moreover, once enrollment is complete, the health plans will find they make profits on healthy enrollees and losses on sick ones. Thus, they will have

an <u>incentive to overprovide to the healthy</u> (to keep the ones they have and attract more of them) and to underprovide to the sick (to encourage the exodus of the ones they have and discourage any new ones). The effects of these incentives are already becoming apparent in the <u>federal employees' health plan</u>. They would be more pronounced in a system-wide exchange.

The changing nature of insurance. Remember the TV ads that end with the statement, "You're in good hands with Allstate"? These ads ask you to focus on how the insurer will treat you if something goes wrong. They promise you that you will get really good treatment if you are ever unlucky enough to need the insurer to pay claims. Federal employees almost never see health insurance ads like this. During the "open season," for example, insurance company advertisements tend to picture young, healthy families with children. They never mention what would happen if you were unlucky enough to have heart disease, cancer or AIDS. That's because health insurers don't want enrollees who are focused on expensive-to-treat problems. Since there are no preexisting illness limitations in an exchange, the healthy employees may assume that if they ever get sick they can always switch to a plan that is good at treating their particular illness. Unfortunately, they may find out too late that plans skilled in treating expensive problems have been driven from the market.

The effects of low reimbursement rates. We do not know many details about how the exchanges will work under the new health reform law. In Massachusetts, however, subsidized health plans are paying providers fees equal to Medicaid rates plus about 10%. Since these rates are well below the market rates, doctors prefer to see private-paying patients first and then Medicare patients — pushing patients from the exchange to the rear of the waiting line. This may make it more difficult for you to obtain the care you need, when you need it.

How Will My Employer or Health Insurer Know What My Income Is?

The government will require you to give your employer your most recent income tax return.

Both at work and in the newly created health insurance exchanges, out-of-pocket premiums will be limited to a percent of your income. In order to enforce that requirement, however, your employer or the operator of the exchange will have to know what your income is.

Note: Under the new law, the income-based premium limits are not based on the wages your employer pays you. They are based on *your family income* — including nonwage income (dividends, interest, trust income, etc.), your spouse's income (from all sources) and, if your children are dependents, their incomes as well.

How Will the Government Enforce the Requirement to Buy Insurance?

The enforcer of health reform is the Internal Revenue Service (IRS).

On your annual tax return you will be required to show proof that you and other members of your family have the minimum insurance the government is going to require almost everyone to have. Failure to provide proof will subject you to tax penalties that will reach \$695 (individual) or \$2,085 (family) or 2.5% of your income, whichever is greater, in 2016.

Further, providing fake information (claiming you have insurance when you don't) will subject you to the same penalties that would apply to other types of fake IRS reporting.

Some analysts estimate the IRS will need to hire <u>16,000 additional agents</u> to enforce the requirement that everyone obtain individual health insurance.

What If My Income Has Changed Since My Last Tax Return?

On January 1, 2014, you will have to have insurance. But your subsidy in the exchange will be based on your income tax return for 2012. What if your income is very different in 2014 than it was in 2012? In that case, the subsidy you are awarded could be too high or too low. In fact, it's almost certain that it will be too high or too low, unless every member of your family is living with a two-year wage freeze and doesn't change jobs.

In general, this problem will be dealt with when you finally file your 2014 tax return. If it turns out that your 2014 subsidy was too high, given your actual income that year, the IRS will be able to reclaim part of the unwarranted portion by collecting additional taxes from you. If it turns out that your subsidy was too low, you can file for a refund for the amount of the underpayment.

Strangely, these outcomes are not symmetrical. There is a limit on what the IRS can reclaim from you (up to \$250 in overpayments for an individual and \$400 for families) but no limit on the underpayments you can reclaim from the IRS.

What If I Get a Raise?

Individuals and families who do not have employer-provided health insurance or other government coverage will be required to obtain coverage through a health insurance exchange, where you will be eligible for subsidies based on your income. If you earn 133% of the federal poverty level (currently \$14,404 for an individual and \$29,327 for a family of four), the subsidy will limit the premium to 3% of your income. The subsidy will limit the premium you must pay to 9.5% of your income at 400% of the federal poverty level (currently, \$43,320 for an individual and \$88,200 for a family of four). Above that level, you will receive no subsidy and you will have to pay the full price yourself.

As your income rises, the subsidy falls and the premium you must pay rises. This rising premium is like a tax and the marginal rate will be very high.

For example, the <u>CBO estimates</u> that a family of four with an income of \$54,000 will receive a health exchange subsidy of \$14,300. The subsidy would drop to \$10,500 once the family's income reaches \$66,000. Over the range, for each extra dollar of income the family earns, it must pay an extra 32 cents in higher health insurance premiums.

When the effects of the subsidy withdrawals are added to income and payroll taxes, most people will <u>lose more than 50 cents for each \$1 they earn</u>. It will be about a 60 cent loss for people with incomes between about \$24,000 and \$35,000.

What If I Have My Own Insurance?

During the debate over health reform, the most talked-about problems with the current system were "abuses" in the market where people buy their own insurance. Purportedly, insurers were rescinding policies for enrollees after they became sick and denying coverage to people with pre-existing conditions. The irony is that over the next four years you are now more vulnerable if you own your own health plan.

One reason is that many insurers that sell insurance to individuals are leaving the market precisely because of the new regulations. A limit on insurance company overhead (called the "medical loss ratio"), for example, has already caused some companies to leave the market and many more are expected to follow. In fact, one company is predicting that only a small number of insurers will still be around in a few years.

Another problem: A new requirement that insurers can no longer have an annual limit on benefits will cause more than <u>1 million people to lose their limited benefit plans</u> in September when the provision takes effect. And regulations governing insurance for children are causing some insurers to <u>quit selling children's policies altogether</u>.

If you lose your current plan and you have a pre-existing condition, you could be in trouble. The new law authorizes \$5 billion dollars in federal funds for states to establish temporary high-risk pools for the next four years. Estimates vary, but more than 2 million people are probably eligible. Yet the CBO estimates enrollment will have to be limited to 200,000. At this rate, the amount of funding is <u>expected to cover only about 10%</u> of those who will need risk pool insurance.

Beginning in 2014, you will be able to buy insurance in a health insurance exchange. Competing insurers will be required to offer coverage to the healthy and the sick for the same premium, regardless of pre-existing conditions. If you are healthy, the premiums in the exchange may be much higher than the premiums you pay today. In fact, families purchasing health insurance on their own are <u>likely to pay an additional \$2,100 a year in premiums</u>, according to the CBO.

What If I Am Uninsured?

You will have to show proof that you have insurance on your income tax return. The fine you will have to pay if you fail to comply will begin at \$95 (\$285 per family) or 1% of income in 2014 and rise to \$695 (\$2,085 per family) in 2016 or 2.5% of your adjusted gross income, whichever is greater.

There are several ways you may obtain health insurance that qualifies:

- If your employer offers health insurance, you may sign up for an employer-provided plan (but this is not a requirement).
- Provided your income is not lower than 133% of the poverty level, you may obtain insurance in the health insurance exchange.
- If you qualify for Medicaid or some other government insurance plan, those plans will generally qualify automatically.

What If I Am Uninsurable?

The new law provides funds for the creation of risk pools for otherwise uninsurable people — to bridge the gap from where we are now to 2014, when health plans will have to accept everyone regardless of health condition.

The new risk pools will be cheaper and more generous than what the states currently have. For example, they will <u>charge you the same premiums</u> that healthy people pay for insurance, in contrast to existing state risk pools which charge from 125% to 200% of market rates. Also, the new risk pools will have no waiting period. You get full coverage from day one. One problem is they <u>only reimburse doctors at Medicaid rates</u>. You may have coverage but not be able to find a doctor who will see you. (See "<u>What If I Have to Be in Medicaid?</u>")

That is <u>not necessarily good news</u> if you are one of the 199,000 people who are currently enrolled in a state risk pool. The new law is explicitly designed to keep you from moving out of the risk pool you are in to a new one. Also, you cannot enroll in one of the new risk pools unless you've been uninsured for at least six months.

Another problem is funding. Although the newly enacted health reform legislation has allocated \$5 billion for this project, the Medicare chief actuary says <u>this is too little money to meet the</u> <u>need</u>. It will likely cover only about 200,000 out of a potential population of more than 2 million. This is why <u>18 states are refusing the money</u> to create these pools. By ceding the problem to the federal government, these states are choosing to make inadequate financing a federal problem rather than the state's problem in future years.

Can I Keep My Doctor?

You may not be able to. For example, you may end up in a plan that restricts your choice of doctors. Or your doctor may end up in a plan that restricts her choice of patients. Also, the demand for doctor services will greatly exceed supply — creating new rationing problems.

What If There Aren't Enough Doctors? If <u>government estimates</u> are correct, as many as 34 million uninsured people will acquire health insurance. If economic studies are correct, these 34 million people will try to double their consumption of health care.

In addition to the newly insured, many people will be required to be in health plans with more generous coverage than they have today. All told, as many as <u>100 million people</u> may acquire health insurance benefits they do not have today. These 100 million people may be expecting annual physicals, mammograms, Pap smears, prostate cancer (PSA) tests, colonoscopies and other services they are not currently getting. Moreover, most of the remaining 200 million people will be entitled to preventive services without copayments and deductibles they pay today.

Yet with no increase in supply, there is no realistic way for doctors to meet this demand. More than one in five Americans already lives in an <u>underdoctored area</u> and the shortage will get much worse. For example, a <u>Duke University study</u> implies that if all Americans get all the free preventive care promised them under the Affordable Care Act, family doctors will have to spend all their time on these tasks alone — leaving no time left over for all of the other things doctors do.

A <u>new government Web site</u> claims there will be 16,000 new providers by 2015. Yet Congress has never appropriated the funds to do that. In fact, all funds for training new providers were zeroed out of the Affordable Care Act. (That was one of the ways Congress kept the spending

total from being unacceptably high.) Apparently, HHS Secretary Kathleen Sebelius plans to <u>use \$250 million</u> targeted for "prevention and public health" in the bill to instead train 500 physicians, 600 physician assistants and 600 nurse practitioners. Also, she plans to use an additional \$500 million of "stimulus" money available under the American Recovery and Investment Act. Yet even if Congress allows these decisions to go forward, the additional supply will still fall way short of the 16,000 figure (which appears to count students who are already in medical school and will largely replace doctors who are expected to retire).

Meanwhile, the Association of American Medical Colleges predicts a 21,000 primary care physician shortfall by 2015, and the <u>Health Resources and Services Administration</u> estimates a shortage of between 55,000 and 150,000 physicians by 2020 — and that was before health care reform passed! The state of <u>Texas is predicting a nursing shortage</u> of 18,000 by 2015 in that state alone.

How Will Doctors Decide Which Patients to Treat? When demand for care expands faster than increases in supply, doctors will have to decide which patients they see first. You will be at a disadvantage if you are in a health plan that pays below-market rates. <u>Nationwide</u>:

- Medicare pays doctors about 19% less than private plans.
- Medicaid pays about 28% less than Medicare.
- Subsidized plans in the Massachusetts health insurance exchange (the model for the new federal law) pay doctors only about 10% more than Medicaid rates and this practice may be repeated in the exchanges set up in other states.

What about Hospital Emergency Rooms? Because of the access-to-care problems, the <u>National Center for Policy Analysis</u> and <u>other researchers</u> are predicting that there will be a substantial increase, rather than a decrease, in the number of patients who seek care at hospital emergency rooms.

In general, emergency room use by the uninsured and the privately insured are about the same. Medicaid enrollees, on the other hand, have more than twice as many visits, and about <u>half of all newly insured people will be enrolled in Medicaid</u>. Consequently, the NCPA projects that enrolling 16 million to 18 million new people in Medicaid will generate *between 848,000 and 901,000 additional emergency room visits every year*.

Will My Relationship with My Doctor Change?

It may.

Unanswered Questions. Here are just a few of the questions doctors are hearing from their patients these days about health reform:

- Will I be able to choose the doctor who treats me, or will I have to accept whatever doctor is available like in a hospital emergency room?
- Will I be required to stay in a network of doctors, or will I be free to see doctors outside the network?
- Will there be a limit on the number of times I can see a doctor?
- Will doctors be pressured to limit the time they spend with me?
- Will doctors be free to prescribe the drugs I need, the tests I require and the procedures that are indicated?
- Will doctors be free to exercise their best judgment in treating me? Or will doctors be forced to conform to guidelines written by people who may be more concerned with controlling costs than curing disease, treating illness and saving lives?

Unfortunately, at this point, no one can be sure of the answers.

Vision of the Supporters of Reform. Some of the supporters of the Affordable Care Act have been very explicit. Harvard Medical School professor <u>Atul Gawande</u>, for example, thinks that medicine should be more like engineering — with all doctors following the same script, rather than exercising their individual judgments:

This can no longer be a profession of craftsmen individually brewing plans for whatever patient comes through the door. We have to be more like engineers building a mechanism whose parts actually fit together, whose workings are ever more finely tuned and tweaked for ever better performance in providing aid and comfort to human beings.

Karen Davis, president of The Commonwealth Fund, envisions a <u>complete reorganization</u> of the practice of medicine:

The legislation also includes physician payment reforms that encourage physicians, hospitals, and other providers to join together to form accountable care organizations [ACOs] to gain efficiencies and improve quality of care. Those that meet quality-of-care targets and reduce costs relative to a spending benchmark can share in the savings they generate for Medicare.

Worries of the Critics of Reform. Critics worry that in actual practice reform efforts will fall very short of the goals; that practice guidelines, rather than representing the best that medicine

has to offer, will become cookbook recipes; that while these recipes may work for most patients most of the time, doctors will not feel free to make exceptions for patients that don't fit the norm; rather than resemble a finely honed machine, the health care system will come to resemble the U.S. Postal Service — even more than it already does.

Accountable Care Organizations (ACOs), for example, have been described as "HMOs on steroids." On paper, it sounds as though doctors will be rewarded for providing higher-quality services. In practice, ACOs may reward doctors for underproviding care, just like traditional HMOs were accused of doing.

Moreover, the entire business model of the ACO requires that patients see only the doctors that the ACO employs. If you are getting care from an ACO, therefore, you won't be allowed (your insurance won't pay for you) to see doctors outside the ACO. Also, part of the ACO vision is that all doctors and nurses will practice medicine in the same way. This means that when you visit an ACO clinic you will not necessarily see the same doctor you saw on your last visit. ACOs will probably be given a lot of freedom to limit the terms and circumstances under which you can see doctors.

Where Private Insurance is Headed. Even if you are not enrolled in a traditional HMO or an ACO, you can expect a return to some of the heavy-handed health insurance industry practices that were so unpopular in the 1990s and gave rise to the "patient bill of rights" proposals. The reason? The new health care reform takes away just about every other tool insurers have to control costs. In response to the new law, for example, health insurers are already trying to keep premiums down by offering policies that cover, say, <u>only half the doctors in the area where you live</u>. In some of these plans, you get no reimbursement whatsoever if you see a doctor outside the insurer's network.

Levers of Government Power: Medicare. Will the federal government be able to tell doctors how to practice medicine? An undisguised goal of health reform is to change what most doctors do. The Medicare payment system, for example, will be used to push doctors to use electronic medical records, join group practices and ultimately join ACOs. Doctors who do these things will be paid more. Doctors who don't will be paid less. In addition:

- A Federal Coordinating Council for Comparative Effectiveness Research will study alternative ways to treat various conditions, and Medicare itself could refuse to pay doctors and hospitals who refuse to follow the guidelines.
- There will almost certainly be national guidelines governing who should get diagnostic tests, under what conditions and how often. Medicare doctors are likely to have much less discretion about such diagnostic tests as mammograms, Pap smears, PSA tests, colonoscopies, etc.

Medicare doctors are also likely to have much less freedom to order CT scans, MRI scans, PET scans, sonograms, etc.

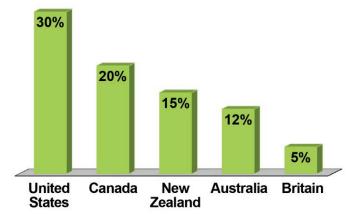

Levers of Government Power: The Private Sector. The government will have less control over the way in which doctors practice medicine for patients who are privately insured. However, health plans in the exchange will face competitive pressure to limit what they spend on people with expensive health problems. Undoubtedly, federal guidelines for Medicare will give these plans cover to adopt the same payment strategies for physicians seeing the privately insured. Ultimately, whatever happens under Medicare is likely to spread to the entire private sector.

What Other Countries Have Done. President Obama has said many times that the overriding problem in health care is cost. Health care spending is rising at twice the rate of growth of our incomes. If this trend continues, health care will eventually crowd out every other form of consumption. In this respect, the experience of the United States is not worse than that of other countries. In fact, the real rate of growth of per capita health care spending is right below the <u>average for all developed countries</u>. What makes our country different is that our government has been less involved in cost control efforts.

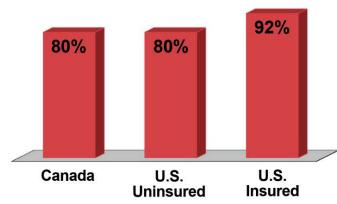

How have other countries tried to control health care spending? In general, they have substituted inexpensive services for expensive ones. Citizens of Britain and Canada, for example, see physicians more often than we do. But as the graph below shows, doctors in other countries spend less time with patients on each visit. Also, patients in Britain and Canada have less access to diagnostic tests, even though on paper they are supposed to get all the health care they need for free. Surprisingly, *uninsured patients in the United States* appear to get as much or more preventive care than *insured Canadians*.

What about Preventive Care?

The new health care law promises people on Medicare annual wellness exams, mammograms, prostate cancer screenings and other preventive services — without any copayment or deductible. The rest of the population will also have access to a lengthy list of preventive services. Unfortunately, the law that mandated these benefits contained no provision to make sure doctors will be able to supply them.

What Services Will I Be Entitled To? The law requires that after September 23, 2010, all new health plans (plans that are not "grandfathered") must cover the preventive services recommended by the U.S. Preventive Services Task Force, without cost-sharing. Depending on your age and sex, the following preventive services will be covered by your health insurance:

- Blood pressure, diabetes, and cholesterol screening.
- Cancer screenings.
- Counseling on weight loss, healthy eating, smoking cessation, alcohol use and depression.
- Vaccines for measles, polio, meningitis and the human papillomavirus (HPV).
- Shots for flu and pneumonia prevention.
- Screening, vaccines and counseling for healthy pregnancies.
- Well-baby and well-child visits up to the age of 21, as well as vision and hearing, developmental assessments and body mass index (BMI) screenings for obesity.
- Mammograms for women over age 40.
- Pap smears for cervical cancer prevention.
- Colon cancer screening tests for adults over age 50.

Will I Be Able to Get the Preventive Services Promised Me? The answer is probably not. Providing preventive care takes time and most primary care physicians already have their hands full. Ask yourself this question: The last time you were in a primary care facility, did you observe a lot of idle resources? Were there doctors and nurses standing around with nothing to do? If the answer is "no," your experience is not unique. Nationwide, more than one out of every five people is <u>living in an underdoctored area</u> and the shortage of primary care physicians is expected to grow worse in future years.

A study published in the <u>American Journal of Public Health</u> analyzed how much time it would take physicians to arrange for and counsel patients about all the screening tests recommended by the U.S. Preventive Services Task Force. The bad news: It would require 1,773 hours of your doctor's time each year, or 7.4 hours per working day. And all of this time is time spent searching for problems and talking about the search. If the screenings turn up a real problem, there will have to be more testing and more counseling. Bottom line, to provide all the services being promised, your doctor would have to work twice as long! To meet this promise nationwide, every family doctor in America would have to work full-time delivering them — leaving no time for all of the other things doctors do!

Furthermore, since preventive screenings are often reimbursed at lower rates than other services, when you call your doctor for a preventive care appointment, you may find there is long wait. Increasing the demand for doctors without significantly increasing the supply will lead to increased rationing of their time.

Is Preventive Medicine Cost Effective? Much rhetoric suggests that preventive care pays for itself. If a disease is caught in its early stages, treatment costs will be lower. So can wider access to preventive care lower the nation's health care costs? In general, no.

At the individual level, the old adage that an <u>ounce of prevention is worth a pound of cure</u> is true. For the few patients who are diagnosed with a disease, preventive screenings are definitely worth the cost. But the cost of screening thousands of healthy patients in order to find one patient with a problem usually swamps any savings on patients whose diseases are diagnosed early.

In general, <u>preventive medicine adds to health care costs</u>, rather than reducing costs. Mammograms don't pay for themselves. Nor do Pap smears. Nor prostate cancer tests. Nor general checkups for healthy people. That doesn't mean we should avoid these tests. But since these tests add to total spending on health care, we should obtain them judiciously.

There are some exceptions — childhood immunizations and prenatal care for at-risk mothers, for example. But the exceptions are few and far between. Louise Russell, who has studied the economics of preventive care for years, explained this in a recent article [gated, but with abstract] in <u>Health Affairs</u>:

"Over the past four decades, hundreds of studies have shown that prevention usually adds to medical spending. [Data] from 599 studies published between 2000 and 2005 [show that] less than 20 percent of the preventive options (and a similar percentage for treatment) fall in the cost-saving category — *80 percent add more to medical costs than they save*." [Italics added.]

Can We Use Medical Science to Decide What Preventive Care People Should Get? Who should get a mammogram? At what age? How frequently? What about Pap smears and prostate cancer tests and colonoscopies? Aren't these questions experts can decide? Unfortunately, no. Any reader of daily newspapers knows that we are forever getting conflicting advice from well-meaning people. Part of the problem is that people differ in their attitude toward risk. They also differ in their willingness to spend money to reduce risk. A danger in a one-size-fits-all approach fashioned in Washington, D.C., is that the experts may not share your values. Their attitude toward risk reduction may be different from yours.

The Danger of Cookbook Medicine. Another danger is that doctors harried by far more requests for services than they can possibly deliver will take a routine approach to all their patients and ignore what makes you unique as an individual. What if you feel you are at a heightened risk for breast cancer because your mother or grandmother had breast cancer — but you fall outside the guidelines for early breast cancer screening before age 40? Women at higher risk of breast cancer might want to begin them at age 25, as <u>recommended by the Komen Foundation</u>. But will you be allowed to do so? If necessary, will you be allowed to pay for the test yourself? These questions need to be asked and answered.

The Dangers of the Politics of Medicine. Both Congress and the administration have already shown that they are unwilling to let experts set the guidelines for preventive care. For example, the new law stipulates that seniors are entitled to an annual physical and that males are entitled to an annual prostate cancer test — even though neither is recommended by the Preventive Services Task Force. Also, HHS Secretary Sebelius has chosen to include annual mammograms for women in their 40s, even though the task force recommended against it.

Expect more politics to come. Women's groups are pushing for free contraceptives under the guise of "prevention."

Also, while more "free" services may sound good, remember that the doctor's time is limited, as are the number of health care dollars. Granting more marginal care to one person may mean less really serious care for another.

Letting Individuals Make Their Own Choices. There is a better way. Instead of one-size-fitsall medicine, individuals can make a lot of their own choices in these matters. Instead of giving all of your health care dollars to an impersonal, bureaucratic insurance company, you should be allowed to put some of those dollars in a <u>health savings account</u> that you own and control. That way, you could consult the advice of the Preventive Services Task Force on your own. You could also consider the advice of other experts, including your doctor, and take into consideration personal data about you and your family.

Ultimately, no one cares about you more than you care about you. So if you control more of the money and if you are allowed to make more of your own decisions, the system is likely to work better for you than if you cede that power and control to others.

Preventive care is not like an *investment good* that pays a positive rate of return. Instead, it's like a *consumption good*. Preventive care leads to better health. But the enjoyment of that result must be compared with the benefit of other goods and services we could have purchased with the same money.

Are Electronic Medical Records Safe, Effective and Private?

Doctors who see Medicare and Medicaid patients will face financial penalties if they fail to adopt electronic medical records (EMRs), under the 2009 federal stimulus bill. This is the first step the government has taken toward a goal of universal EMRs by 2014.

When you visit your doctor, a record of the visit will be stored electronically. The record will contain all of the information exchanged between you and your doctor, your doctor's notes, any drug prescriptions you receive and any disease prognosis you are given. Your EMR will even contain a government-approved obesity rating — a body mass index measuring your body fat percentage. These obesity ratings will be sent automatically to federal health agencies such as the Department of Health and Human Services and the Centers for Disease Control, and will also be posted on a national exchange. (To insure privacy, your name will be withheld.) Another government goal is to make sure your EMR is compatible with other records and kept in a format that can be accessed by other doctors and hospital personnel, regardless of where you seek care.

Is this a good idea?

Will EMRs Improve the Quality of My Care? Maybe. Or maybe not. Formal evaluations are generally lacking and the jury is still out. Potentially, EMRs could enhance the coordination of care among diverse doctors and hospitals. They would be able to see which tests you have already undergone and their results, thereby saving you the money and inconvenience of duplicate tests. They would be alerted to prescription drugs you are taking, any drug allergies you may have and other vital information. This information should allow doctors to deliver safer and more effective care.

On the other hand, if your EMR is not properly maintained, doctors could make serious mistakes that could be hazardous to your health. For <u>example</u>:

- In one case, a mother of three died of cancer after going untreated for three to six months because the report from her radiologist was not filed properly in the her EMR, leaving her referring physician completely unaware of her condition.
- Another lab test result that was not properly filed in a patient's EMR ultimately caused the patient to suffer from acute renal failure.
- Records that were entered into the wrong EMR left another patient untreated for congestive heart failure, from which he later died.
- A woman's baby was born brain dead and later died due to umbilical strangulation when her OB/GYN, monitoring the baby's birth from his home using the patient's EMR, was unaware of software glitches that concealed vital patient information.
- In another case, three days passed before a patient's care team realized the results entered into his EMR were for a biopsy they did not order of a lesion the patient did not have.

These mistakes are more common than you might suppose. There have been more than 200 <u>adverse events associated with EMRs</u> reported to the Food and Drug Administration in the past two years.

Another problem is information overload. The time your doctor spends entering your data can detract from your care. A doctor struggling to enter patient information into multiple screens — each with multiple check boxes — could miss subtle clues that might have been observed if she were interacting with you face-to-face. Furthermore, some EMRs automatically generate redundant information that can clutter a record containing important medical problems or create false-alarm alerts for minor drug interactions.

Will EMRs Save Money? Two highly influential studies by the <u>RAND Corporation</u> and the <u>Center for Information Technology Leadership</u> estimated health information technology — including EMRs — could potentially save \$77 billion to \$78 billion per year if adopted by virtually all doctors and hospitals. However, most doctors and most hospitals find that the <u>adoption of EMRs adds to their costs</u> rather than reducing them. So, as with the question of quality, the jury is still out.

How Well are EMRs Working Where They Have Been Adopted? That depends. EMR systems seem to work well where they have been voluntary chosen by doctors trying to solve their own information flow problems. They do not seem to work well when they are imposed top-down, <u>against the doctors' wishes</u>.

Will My Privacy Be Protected? Some of the information in your EMR may be potentially embarrassing. It could also be used against you — say, by an employer trying to avoid workers with costly health conditions, or even by an unfriendly coworker. Almost everyone who knows anything about the subject knows that no matter how much effort is made to secure the records, EMRs always entail a risk to patient privacy. Hospital or medical office employees, for example, have been known to steal electronic medical records. And EMRs will always be susceptible to hackers motivated by voyeurism or out to steal personal information in order to cash in by making false claims.

- A California Health Department investigation of incidents of patient "snooping" at the UCLA Medical Center found that over a five year period more than 100 hospital workers had <u>inappropriately viewed the records of 1,041 patients</u> —including California first lady Maria Shriver.
- Actress <u>Farrah Fawcett's EMR was hacked</u> into while she was undergoing treatment for cancer, resulting in details of her treatment being made available to the public.
- After Dallas Cowboys Pro Bowl defensive tackle Erik Williams suffered a season-ending knee injury in a car accident, his <u>electronic records were viewed online</u> by 1,754 separate Parkland Hospital employees. Less than a few dozen people had a medical reason to view them.
- In Britain, computer hackers were even able to obtain the medical records of British <u>Prime Minister Gordon Brown</u>.

What about Identity Theft? Electronic medical records make this type of crime much easier. In 2006, an individual whose cousin provided him with the <u>EMRs of 1,100 Medicare patients</u> from a clinic where he worked made \$2.8 million in fraudulent claims. The federal government reports more than <u>250,000 incidents of medical identity theft</u> in 2007 alone. The real number of victims of medical identity theft is probably much higher, however. Most patients are unaware of any misdeed until they see their credit report or are informed by their insurance company that their lifetime cap on benefits has been reached.

What Will Happen to My Taxes?

You will join other Americans in paying more than <u>\$500 billion in 19 new types of taxes</u> and fees over the next decade to fund health reform. Some of the new taxes will be indirect and will be passed on to you in the form of higher prices, higher premiums or lower wages. You will pay others directly. According to the <u>Joint Committee on Taxation</u>, about 73 million taxpayers earning less than \$200,000 will see their taxes rise as a result of various health reform provisions.

Tax on Medical Devices. These taxes will reach everything from surgical instruments and bedpans to wheelchairs and crutches. Even pacemakers and artificial hips and knees are taxed, as well as such drug store items as bandages and toothbrushes. All told, the tax on medical devices will collect nearly \$20 billion over the next decade.

Tax on Insurance. A \$60 billion tax on health insurance, beginning in 2014, will ultimately be reflected in higher premiums. For example, the <u>Finance Committee's Republican staff</u> estimates the new taxes — including taxes on medical devices, taxes on drugs, taxes on insurers — could ultimately push up health insurance premiums for a typical family of four by nearly \$1,000 per year.

Tax on Drugs. The new tax on drugs will collect about \$27 billion. In anticipation, some drug makers have <u>already started raising their prices</u>. These taxes and the changes in the treatment of medical savings accounts (described below) have been called the "medicine cabinet tax."

Tax on Medical Savings Accounts. If you have a flexible spending account (FSA), a health reimbursement arrangement (HRA) or a health savings account (HSA), you will no longer be able to use these tax-free accounts to purchase over-the-counter drugs. That means you will have to buy such items as the Claritin, aspirin or Advil with aftertax dollars — making the cost to you 30% higher or more. In addition, tax-free contributions to an FSA will be capped at \$2,500 annually. People setting aside funds for chronic care, corrective eye surgery or other out-of-pocket medical expenses will be limited to \$2,500 regardless of medical need. Taken together, these two actions are expected to cost consumers \$18 billion over the next decade.

Taxes on Indoor Tanning. If you plan to use an indoor tanning bed, expect to pay 10% more thanks to a new excise tax expected to raise nearly \$3 billion.

Taxes on Cadillac Plans. A 40% excise tax will be levied on so-called "Cadillac" health plans for the amount in excess of \$27,500 for families and \$10,200 for single coverage. About one-third of health plans will be subject to the tax beginning in 2019. But since these thresholds are not indexed to increase as fast as medical costs, over time virtually all plans will be subject to the tax.

Taxes on Illness. If you have a lot of medical expenses, today's tax law allows you to deduct from your taxable income the amount that exceeds 7.5% of your adjusted gross income (AGI). Under the new law, this threshold is being raised to 10% of AGI — making your deduction smaller.

Additional Taxes on Wages, Investment Income and Even Home Sales. The Medicare payroll tax will increase by almost one-third for individuals and couples — from 2.9% today to 3.8% on wages over \$200,000 for an individual or \$250,000 for a couple. In addition, the 3.8% Medicare payroll tax will be levied on investment income (capital gains, interest and dividend

income) at the same income levels. This tax will not merely reach the rich, however. Under some circumstances, the sale of a house could trigger the provision, making you "paper rich" for a single year and forcing you to pay a 3.8% levy on a portion of your home's appreciated value above a certain limit. Moreover, the threshold above which people must pay the higher tax is not indexed to rise with inflation. Consequently, over time more and more middle-class Americans will have to pay it.

What If I Am on Medicare?

You and others like you are probably going to be more affected by the new health reform law than any other population group.

Benefits of Reform. There are a number of new benefits, including:

- Medicare will pay for an annual checkup.
- Deductibles and copayments for many preventive services and screenings (colonoscopies, mammograms and bone mass density tests, etc.) will be eliminated.
- If you are in the prescription drug "doughnut hole" and you are not getting other drug subsidies, you may qualify for a \$250 rebate.
- Eventually (in 2019), the doughnut hole will be eliminated.

Meeting the Promises of Reform. How do you know that when you and millions of other elderly and disabled patients try to get your free annual checkups, your mammograms, your colonoscopy, etc., that there will be enough doctors, nurses, laboratories and testing equipment to supply these new services? You don't. Unfortunately, there are no provisions in the new health reform law to provide the funding needed to make sure these promises can be kept. If everyone on Medicare took advantage of a free annual checkup, for example, we would need 23,000 additional doctors just to meet the demand.

Costs of Reform. There will be significant costs for the elderly and the disabled:

- More than half the cost of health reform will be paid for by <u>\$523 billion in reduced</u> <u>Medicare spending</u> over the next 10 years.
- In general, these Medicare spending cuts exceed the new benefits by a factor of more than 10 to one.
- More than <u>\$200 billion in spending cuts</u> are directed at Medicare Advantage (MA) plans.
- As a result, one of every two people expected to participate in Medicare Advantage over the next 10 years (7.4 million of 14 million) will lose their coverage entirely, according to

<u>Medicare's chief actuary</u>; and those who retain their MA coverage will face steep cuts in benefits or hefty increases in premiums, or both.

 In addition to these direct costs there are indirect costs, including new taxes on drugs and medical devices — items that are disproportionately used by seniors and the disabled.

To make matters worse, the planned cuts in Medicare fees may cause some doctors to retire and force some hospitals out of business, according to <u>Medicare's chief actuary</u>. Moreover, as 100 million newly and more generously insured people try to increase their consumption of medical care, you may find it increasingly difficult to obtain the care you need.

Coverage for Prescription Drugs. Another change that may affect you is the potential loss of your employer's retiree drug plan. Under current law, employers who provide their employees with postretirement health care benefits can set up and administer retiree drug plans as an alternative to Medicare Part D. In return, employers get subsidies worth about \$665 per retiree, and tax breaks make the value of the subsidy even higher. The Patient Protection and Affordable Care Act <u>removes the tax subsidy</u>, however, and the loss to major employers is substantial:

- AT&T estimates the change will cost it \$1 billion.
- John Deere estimates it stands to lose \$150 million.
- Caterpillar puts the loss at \$100 million.
- A Credit Suisse report estimates that S&P 500 companies face losses of \$4.5 billion.

In response, many large firms will completely do away with their retiree drug plans.

In addition, 27 million seniors will pay higher premiums for the Medicare Part D Plan in order to allow the doughnut hole to be closed. Only 4 million seniors are thought to reach the doughnut hole annually; but fewer than 1 million will surpass the threshold and receive the full benefit of closing the doughnut hole. <u>Expect your premiums to rise</u> by 4% in 2011 and by 9% in 2019.

Size of the Cuts in Medicare Spending. The table below lists the expected spending reductions for Medicare enrollees over the next several years. As the table shows, if you are in conventional Medicare you can expect that reduced spending will average \$22 next year, rising to \$290 in 2014. If you are in a Medicare Advantage plan, you can expect more severe cuts: \$195 beginning next year, rising to \$1,267 in 2014. If you are able to retain your coverage, these cuts will lead to increases in premiums and/or reductions in benefits.

Cuts in Medicare Spending per Person

C	Conventional <u>Medicare</u>		ledicare <u>vantage</u>	
2011	\$ 22	\$	195	
2012	112		585	
2013	201		877	
2014	290	1	,267	

Sources: <u>National Center for Policy Analysis</u> and the <u>Congressional Budget Office</u>

The Obama administration claims that it will target these cuts to eliminate waste — to encourage low-cost, high-quality care and discourage high-cost, low-quality practices. Critics are not hopeful. In fact, Medicare's own actuaries believe that the most likely way in which spending cuts will be made is through a reduction in fees paid to doctors, hospitals and other providers. As is reflected in the chart below:

Simulated Comparison of Relative Medicare, Medicaid, and Private Health Insurance Prices Under Current Law 125% PHI 100% Price as a percentage of PHI rates 75% Medicaid 50% Medicare 25% 0% 2010 2020 2030 2040 2050 2060 2070 2080

Calendar year

- Current law requires a 30% cut in Medicare fees paid to physicians over the next three years and additional cuts in succeeding years.
- Medicare fees will fall below Medicaid rates by 2019 and continue to fall further behind other payers in the years that follow.
- By 2050, Medicare will pay only half as much as private plans pay; by 2080, it will pay only one-third.

These cuts are so draconian that the Medicare actuaries warn that doctors will be unwilling to see Medicare patients and hospitals and other facilities will be forced to leave the Medicare program. Overall, the <u>actuaries predict</u> that:

- By 2019, one in seven facilities will become unprofitable and will probably be forced to leave the Medicare program.
- That number will grow to 25% of all facilities by 2030 and to 40% by 2050.

How Cuts in Medicare Spending Will Be Made. The new law assumes that the federal government can make Medicare grow at about half the rate of growth of health care spending overall and eventually no faster than the rate of growth of national income. To achieve this goal, the law gives an Independent Payment Advisory Board (IPAB) the power to recommend spending cuts. Congress must either accept these cuts or propose its own plan to cut costs as much or more than the IPAB's proposal. If Congress fails to substitute its own plan, the IPAB's cuts will become effective. In this way, the growth rate Medicare spending is officially capped.

This approach gives an independent agency much more power than any similar agency has had before. However, there are two problems. First, the IPAB is barred from considering just about any cost control idea other than cutting fees to doctors, hospitals and other suppliers. Second, this implies that Medicare fees will fall further and further behind private payments, making Medicare patients less desirable customers to the medical community. In some parts of the country, doctors are increasingly reluctant to take Medicare patients — including the Mayo Clinic in Arizona. In the not-too-distant future, Medicare patients could find themselves in the same position as Medicaid enrollees — who often are forced to get all their care at community health centers and safety net hospitals. Ultimately, if Medicare spending grows at a lower rate than the health care system as a whole, the elderly and the disabled will end up in a completely different health care system. You will not be able to see the same doctors, enter the same hospitals or get the same quality of care other Americans have access to.

Do Medicare Advantage Plans Deserve a Smaller Subsidy? Critics of the program argue that the government is paying these plans about 13% more than what enrollees would cost if they were in conventional Medicare. While that appears to be true, there is another side to the story:

- Part of the overpayment is due to Congress's desire to make MA plans available in rural areas, where they are less economical.
- Elsewhere, <u>overpayments are creating benefits for enrollees</u> of up to \$825 per person per year, such as extra coverage for drugs.
- Even as Congress cuts MA payments, it is expanding drug coverage for Medicare enrollees indicating that the pressure to provide the benefits will remain after the MA plans are gone.
- MA enrollees tend to be moderate-income seniors who do not have Medigap insurance; thus, MA coverage is <u>solving a social problem</u> that will have to be solved in some other way if MA cannot.
- And if millions of seniors go from MA plans back into conventional Medicare, paying discounted rates to providers, all seniors may find access to care more difficult.

Moreover, the MA plans that are headed for extinction are ostensibly <u>doing many of the things</u> President Obama says he wants to accomplish with health reform:

- They provide subsidized coverage to low- and moderate-income people who could otherwise not afford it.
- They control costs better than conventional insurance by eliminating unnecessary care.
- They provide higher quality care.
- They have no pre-existing condition limitations, and some plans actually specialize in attracting and caring for patients with multiple illnesses.
- They provide an annual choice of plans.
- They even compete against a public plan (conventional Medicare).

What about the Medicare Trust Fund? Department of Health and Human Services Secretary <u>Kathleen Sebelius has claimed</u> that cuts in Medicare spending help Medicare's Trust Fund, making it easier to pay benefits in future years. Yet <u>CBO Director Douglas W. Elmendorf</u> rejected such claims back in January, saying that they amount to impermissible doublecounting. Either the money that is saved by cuts in Medicare spending (a) will be used to pay for health insurance for younger people or (b) will be put aside to pay Medicare benefits in the future. But you cannot use the same dollars to buy two different things. Since the bill explicitly uses cuts in Medicare spending to finance health insurance subsidies for young people, it does nothing to aid the future financial health of Medicare. <u>Medicare's chief actuary</u> has said the same thing.

In fact, differences within the Obama administration led to a series of unprecedented events connected to the release of this year's Medicare Trustees report:

- Several days in advance of the report, <u>Secretary Sebelius released details</u> favorable to the administration — including the claim that health reform would extend the life of the Medicare Trust fund by 12 years.
- Then, when the report itself was released, Richard Foster, Medicare's chief actuary, appended a note disavowing it, encouraging readers to ignore it, and drawing attention to an "alternative report" with entirely different conclusions.
- At the same time, the Medicare actuaries released the alternative report, claiming that the projections in the Trustees' Report were "unreasonable" and "implausible."

What about Andy Griffith? At a cost to the taxpayers of about \$708,000, a television ad features Matlock telling you how great the new health bill will be for you. Yet a fact-check by the Annenberg Public Policy Center finds the claim not believable:

Currently, about 1 in every 4 Medicare beneficiaries is enrolled in a Medicare Advantage plan. For many of them, the words in this ad ring hollow, and the promise that "benefits will remain the same" is just as fictional as the town of Mayberry was when Griffith played the local sheriff.

What about AARP? The organization that claims to represent seniors has been fully supportive of the new law. But the interest of AARP and the interest of seniors are not the same. For example, AARP markets its own Medigap insurance, collecting more in premiums and other revenue from other commercial ventures than it collects in member dues. With fewer seniors in MA plans, the market for Medigap insurance will greatly expand. Moreover, AARP is getting special treatment under health reform. Specifically, <u>AARP's Medigap insurance</u> is:

- Exempt from the prohibition on pre-existing condition exclusions.
- Exempt from a \$500,000 cap on executive compensation for insurance industry executives.
- Exempt from the tax on insurance companies.
- Exempt from a requirement imposed on MA plans to spend at least 85% of their premium dollars on medical claims.

What If I Have to Be in Medicaid?

If you are under 65 years of age, your income is less than 133% of the federal poverty level and you do not have employer coverage, you will have to enroll in Medicaid. In fact, half of the newly-insured under the health care reform are headed for Medicaid — many losing private coverage in the process.

Worse Access to Care. On paper Medicaid is attractive. You are promised coverage for most medical services with no premium and usually no out-of-pocket payments. But Medicaid pays physicians only about 60% as much as private insurers pay and many Medicaid patients have difficulty finding doctors who will see them. Studies show that even the uninsured have an easier time <u>making doctors' appointments</u> than Medicaid enrollees. <u>One survey</u> finds that:

- In Dallas and Philadelphia, only 8% of cardiologists accept Medicaid patients; in Los Angeles, it's only 11%.
- In both Dallas and New York City, only 14% of OB/GYN specialists will see Medicaid patients; the figure is 28% in Miami and 33% in Denver.
- Among general practitioners, the lowest figures are 30% (Los Angeles), 40% (Miami) and 50% (Dallas and Houston).

This may be why <u>Medicare enrollees seek care in the emergency room</u> twice as often as patients covered by private plans. Emergency room visits are likely to increase in the future as millions of people swell Medicaid's rolls.

Worse Health Outcomes. Numerous studies have found that <u>Medicaid enrollees fare worse</u> than patients with private insurance and even worse than patients with no insurance at all! For example:

- A <u>University of Virginia study</u> found that individuals enrolled in Medicaid are almost twice as likely to die as privately insured patients, and about 1/8th more likely to die than the uninsured after surgery.
- A study published in the <u>Journal of the National Cancer Institute</u> found that Florida Medicaid patients were 6% more likely to be diagnosed with prostate cancer at less treatable, later stage than the uninsured. Medicaid enrollees were nearly one-third (31%) more likely to be diagnosed with late-state breast cancer and 81% more likely to be diagnosed with melanoma at a late stage. (Medicaid patients did outperform the uninsured on late-stage colon cancer.)
- A study in the journal <u>Cancer</u> found that the mortality rate for Medicaid patients undergoing surgery for colon cancer was more than three times as high as for the privately insured; and more than one-fourth higher than for the uninsured.
- A study in the <u>Journal of Vascular Surgery</u> found that Medicaid patients treated for vascular problems, including plaque in their carotid (neck) arteries that pump blood to the brain and obstructions in the blood vessels in their legs, fared worse than did the uninsured (however, the uninsured with abdominal aneurysms did fare worse than Medicaid patients).

New Payment Rates. The federal law will increase Medicaid reimbursement rates to Medicare levels (i.e. 80% of what private insurers pay) for primary care physicians in 2013 and 2014. While this change should improve your access to primary care services for those two years, it will do nothing to improve your access to specialists! Moreover, in 2015 states may lower their payment rates for primary care back to the original levels — a likely outcome considering that many states will face large budgetary problems precisely because of Medicaid expansion.

What If I Have a Health Savings Account?

If you are one of nearly 18 million people enrolled in a health savings account (HSA) or a health reimbursement arrangement (HRA) or if you work for the one of every two employers who now offers one of these consumer-driven health plans, in the future you will have fewer options. The new health care law does not outlaw HSA-eligible plans, but it takes away HSA options and future regulations could make these plans impractical and undesirable.

Current Law. Instead of giving all of your health care dollars to an insurance company, the current law now allows you to choose a plan with a high deductible and more limited benefits, and put the premium savings in an account you own and control. Deposits to these accounts may be made with pretax dollars, just like employer-paid premiums, and the accounts grow tax free. Because you get to keep the money you don't spend, self-insuring in this way allows you to directly benefit from being a prudent consumer in the medical marketplace.

Lower Deductibles. The new law reduces the allowed deductible for small group plans (those with fewer than 100 employees) to \$2,000 for singles and \$4,000 for families, beginning in 2014. This is roughly one-third the level allowed under current HSA law. This will limit your ability to save on insurance premiums by joining a higher deductible plan.

Larger Penalties. If you take money out of your HSA for a nonmedical purpose, the law increases the penalty from 10% to 20%, and you will have to pay ordinary income taxes as well. In addition, patients may not use their HSA funds to purchase over-the-counter (OTC) drugs beginning in 2011. This is especially unfortunate, since there is a trend for off-patent drugs to become less expensive, OTC drugs.

Additional Risks. The Secretary of Health and Human Services has the authority to review health plan benefits on an annual basis and determine the "essential" benefits that should be included in all health plans. If the Secretary determines that all plans must have a benefit that violates the regulations for HSA-eligibility, HSAs could essentially be outlawed by the stroke of a (regulatory) pen.

Other restrictions could make HSA plans impractical. For example, one proposal would require your employer to verify that every single HSA withdrawal is for medical care. This would greatly increase the paperwork cost of administering these accounts.

What If I Have a Flexible Spending Account?

The most significant change is an annual limit on contributions you can make to a flexible spending account (FSA). Estimates vary, but about 30 million people are using FSAs. These accounts pay for such things as medical expenses, dental insurance premiums, long-term care and child care with pretax dollars. Funds must be used in the year they are set aside, however. Although most employers limit the amount you can contribute to \$5,000, the new law will limit contributions to no more than \$2,500 a year — indexed to inflation for future years.

The new law also changes the definition of a "qualified medical expense," making over-thecounter (OTC) medications and products no longer eligible for payment through an FSA. Virtually everything in your medicine cabinet that is now tax free (through an FSA) will be taxable in 2011. The list includes: aspirin, bandages, cough syrup, cold medications, antibiotic ointment, first aid creams, pain relievers, cough drops, antacids, sinus medications, allergy medications and nasal sprays. If you are one of millions of people with a chronic condition, the increased cost to you could be substantial.

The impact may even be greater if you are one of the millions of people who use these accounts for long-term care for family members with chronic illnesses. For example, families raising special needs children often deposit funds into an FSA to pay for costly education and behavior therapy. This allows them to use pretax dollars — at a savings of nearly 50% in some cases — to pay for tuition that can top \$1,000 per month.

What If I Am Young?

Like all other individuals, you will be required by federal law to purchase health insurance with the specific benefits the federal government says you must have, regardless of whether you want to pay for them and regardless of whether they are useful. For instance, young single males will be required to purchase a plan that has maternity benefits and well-baby coverage.

Benefits of Reform. Beginning on September 23, 2010, young adults up to age 26 (whether married or unmarried) will be able to enroll in their parents' health plans. Initially, this option will be limited to children who do not have access to an employer plan. However, beginning in 2014, children will be able to join or stay on their parents' plan even if they have access to an employer plan of their own.

Costs of Reform. If you are like most young people, you are healthier and have lower expected costs than older adults. For example, people in their 20s today typically face premiums that are only one-fifth or one-sixth as high as people in their 60s. The likelihood of ill health, and therefore the cost of health insurance, tends to rise with age, but fortunately so does income. People in their 50s and 60s typically pay higher premiums, but their higher incomes allow them to pay higher premiums.

New regulations that take effect in 2014 will dramatically change things, however. Insurers will be required to accept all applicants at rates that are not adjusted for health status. Also, premiums can be adjusted for age but the highest premium can exceed the lowest one by no more than a ratio of three to one. This means that you will face premiums that will be much higher than your expected cost so that older, less healthy adults can pay premiums that will be much lower than their expected costs.

The result: You will have to pay a lot more for your coverage, perhaps even double or triple your current premium. For example, <u>studies based on actual insurance claims data</u> show:

- The premium for a healthy 25-year-old in California would <u>more than double</u> rising from \$107 per month to \$221.
- The family premium for a 40-year-old husband and wife with two children in California would more rise by 42% from \$536 per month to \$763.
- By contrast, a 60-year-old, less healthy couple living in California would only see a drop in their premiums of about 41% from \$1,979 to \$1,165.

Exceptions for Young Adults. If you are under the age of 30 you will have access to health plans that have fewer mandated benefits than the standard plans. These plans will be allowed to have higher deductibles and higher cost-sharing, but your out-of-pocket exposure will be no higher than HSA limits (currently \$5,950 for an individual and \$11,900 for a family). Presumably, these plans will have lower premiums. They will not qualify for premium subsidies in the exchange, however.

Does Marriage Help or Hurt?

It almost always hurts. The reason: Subsidies in the newly created health insurance exchange will treat two singles better than a married couple. Suppose you are earning 200% of the federal poverty level (currently \$21,660). You will be required to pay a premium equal to 6.3% of your income in the exchange — or about \$1,365 for a health plan that has an actual cost of, say, \$5,000. Thus, you and a cohabitating partner who also earns 200% of the federal poverty level could both obtain health coverage for about \$2,730. However, if you marry your partner,

the two of you will be required to pay 9.5% of your income in premiums — or about \$4,115. Being married will cost the two of you \$1,385 a year.

In some cases, getting married may be worth the financial penalty, however. If you and your partner each earn 100% of the federal poverty level (currently \$10,830), you would (individually) qualify for Medicaid and would not be allowed to purchase private coverage in the exchange. However, if you are married, your combined income would disqualify you for Medicaid. If you bought insurance in the exchange, you would be required to pay 4% of your household income (or \$866). The ability to get out of Medicaid (which pays low doctor fees) and into a private plan (which pays market rates) may be worth the extra premium you have to pay — especially if you value more ready access to care.

What If I Run a Small Business?

Unless you employ mainly high-income people, your best option is probably to avoid providing health insurance altogether. If you're not providing it now, you probably shouldn't start. If you are providing it, you will probably find that it is better to stop — at least in 2014 and beyond. The reason: Your employees will be able to obtain insurance that is cheaper (for them) in a new health insurance exchange than you can purchase it as an employer.

And this conclusion is probably valid even if you have to pay a fine for not insuring your employees and even if you forgo the new health insurance tax credit the government will be offering you.

Mandated Health Insurance. If your company employs fewer than 51 fulltime workers, you will be exempt from penalties for failing to offer health coverage. The 51st worker, however, could be a very expensive hire. If you employ 51 or more workers, failure to provide insurance will subject you to a tax penalty of \$2,000 for each uninsured employee beyond the first 30 employees. So growing from 50 to 51 uninsured workers would subject you to a fine of \$42,000 [(51-30) x \$2,000] for adding the last worker. This fine, however, will be much smaller than the cost of providing 51 employees with the insurance mandated under the Affordable Care Act.

If you are already providing insurance, you may be able to retain your current health plan by claiming "grandfather" status. This would make you immune from cost-increasing regulatory burdens, since the mandated benefit package is likely to be more generous and more costly than what you have now.

A Catch-22. Any substantial change in your health plan, however, such as switching to a new insurance carrier, will cause you to lose your grandfather status — even though changing

insurers is the main way small firms keep premiums down. As a result you can accept doubledigit premium increases for your existing insurance — currently averaging 10% to 18% nationwide — or you can shop around for new coverage, in which case you will lose your "grandfather" status and have to comply with dozens of costly new mandates.

- Under a "mid-range" estimate, <u>two-thirds of small business employees will lose their</u> <u>grandfather status</u> by 2013 and will no longer be able to keep the plan they now have.
- Under the worst case scenario, as many as <u>80% will lose their grandfather status</u>.
- By contrast, a <u>self-insured, large company plan or union plan</u> is free to change its thirdparty administrator as often as it likes and still keep its grandfather status.

Employer Access to an Exchange. If you have fewer than 100 employees, you will be able to purchase coverage in a health insurance exchange rather than buy insurance in the small group market. However, your employees will not be able to obtain the subsidies that individuals will receive if they are buying their own insurance. Also, just as insurers selling in the exchange will not be allowed to charge premiums based on health status, that same requirement will also govern the small group market outside the exchange. So at this point, it is unclear whether there will be any financial advantage to using the exchange, if you are paying the premiums.

Uninsured Employees Access to an Exchange. We do not know at this point what health insurance in a health insurance exchange is going to look like. However, the CBO estimates the cost of a family plan will be about \$5,800 (individual) or \$15,000 (family) in 2016. This suggests that the insurance will look a lot like a standard Blue Cross plan paying Blue Cross fees to providers. If so, then any individual earning less than \$70,000 or \$80,000 will be able to get a subsidy in the exchange that is much more generous than the tax subsidy available for employer-provided coverage. (See "How Much Will Health Insurance Cost?")

Take an employee with a family who is earning, say, \$30,000. If you provide the governmentmandated insurance at work, you will have to spend an amount equal to about half the employee's salary. The only subsidy is the ability to pay premiums with dollars that are not included in the taxable income of the employee. Since this employee makes too little to pay income taxes, you will only be avoiding a 15.3% (FICA) payroll tax and that is worth about \$2,811.

If this same employee enters a health insurance exchange, however, he will be charged a premium of only \$900. The government will not only pay the entire remaining premium, it will also reimburse the family for most of its out-of-pocket costs — bringing the total expected annual subsidy to about \$19,400.

So, combining your financial interest with your employee's, there is a potential gain between the two of you of \$16,589 if the employee gets health insurance in the exchange rather than at your place of work. That is money that could be used to pay higher wages, provide other benefits or be added to company profits.

Note also, that the financial gain from sending the employee to the exchange, as opposed to employer provision, in this case far exceeds a potential \$2,000 fine. It also exceeds the value of any small business health insurance tax credit, discussed below.

Potential Benefit: A New Small Business Subsidy. The new law includes a health insurance tax credit that may help you purchase health insurance for your employees. However, the credit is only available for six years and only for firms that have 25 or fewer employees and pay wages that average less than \$50,000. Moreover, most businesses will not meet the strict (and complex) criteria for claiming the credit. In fact, fewer than one-third of small businesses will qualify according to the <u>National Federation of Independent Business</u>, the trade association that represents small business. Also, the credit is not available to sole proprietorships and their families.

Limits on Employee Premiums. If you do decide to provide the mandated health insurance benefit to your employees, you may be required to limit the amount of premiums some employees pay to a percent of their income. For example, health plans are considered "unaffordable" if workers earning less than 400% of the federal poverty level (about \$88,200 for a family of four) are required to pay a premium that is more than 9.5% of their income. The premium for an employee with a family income of \$30,000, for example, would be deemed unaffordable if the premium was any higher than \$2,850. For firms with more than 50 workers, employing a worker whose premiums are unaffordable may result in a \$3,000 fine.

The income that is relevant here, by the way, is not the wage income you pay your employees. The relevant income is the employee's entire family income — including a spouse's income and such nonwage income as interest, dividends and capital gains. To know what these limits are, you are going to have to request the most recent tax return from each employee to whom you provide health insurance.

Potential Cost: Increased Paperwork. Currently, businesses are required to report to the IRS on form 1099 the amounts paid to all contract workers with more than \$600 in business dealings. Beginning in 2012, you will also have to file a 1099 form for all businesses for purchases in excess of \$600. This means that you will have to fill out a federal form, even if you are only buying paper at Wal-Mart.

A business networking organization in Pennsylvania surveyed its members and found most only file 10 form 1099s per year, on the average. Under health reform, the average number of annual 1099s a typical small business would be required to file would rise to more than 200. According to the <u>National Taxpayer Advocate</u>, which operates inside the IRS, these new paperwork burdens will affect 30 million sole proprietorships and subchapter S corporations, 2 million farms and 1 million charities and other tax-exempt organizations.

What If I Am an Early Retiree?

Under the current law, there are three public policy barriers that may stand between you and affordable health insurance:

- Although tax law allows employers to pay premiums for group insurance for active employees with untaxed dollars, employers cannot make premium contributions to the individually-owned insurance of their retirees with untaxed dollars. (You must pay taxes on the employer's contribution and buy insurance with what's left over.)
- Although many employees are able to pay their share of health insurance premiums using premium-only plans set up by their employers, retirees must pay their premiums with aftertax dollars. (This can double the cost of health insurance if you live in a middle-income household.)
- Although the ability to pay premiums with untaxed dollars makes employer-paid health insurance for current medical expenses more affordable, there is no easy way for employers and employees to save for future medical expenses — including postretirement expenses.

Some employers have made promises of postretirement health care. Yet these tend to be allor-nothing propositions. That is, employers can keep their retirees in their group insurance plan — paying with pretax dollars — or they can do nothing. It's hard to be in between. If an employer cannot afford, say, a \$12,000 family plan for a retiree, the employer cannot split the difference and contribute \$6,000 to the employee's individually-owned insurance. Such a contribution would be treated as taxable income.

Unfortunately, the new law solves none of these problems. It does create new subsidies for employer-provided insurance for retirees, but <u>these new subsidies phase out in 2014</u>. Moreover, the subsidies go not to individuals, but to employers. And because higher-income employees are more likely to have an employer promise of postretirement care, the subsidies will go to those who least need them.

When these subsidies end in 2014, insurers — selling in a newly created health insurance exchange — will have to accept all applicants regardless of health condition. Since the difference in premiums an insurer charges in the exchange cannot exceed three to one (rather

than the more normal cost ratio of six to one), the likely impact will be that young people will be overcharged so that 50- and 60-year-olds can be undercharged.

One problem: It appears the mandate may be weakly enforced. If people wait until they get sick to insure, the average premium in the exchange will have to be quite high to cover the costs. As a result, retirees could face higher premiums in the exchange than they would have faced with no reform at all.

Another change that may affect you is the potential loss of your employer's retiree drug plan. Employers who provide their employees with postretirement drug coverage receive subsidies worth about \$665 per retiree, and tax breaks make the value of the subsidy even higher. The Patient Protection and Affordable Care Act <u>removes the tax subsidies</u>, however. In response, many large firms are expected to completely do away with their retiree drug plans. In fact, the latest <u>Medicare Trustees report</u> predicts that 90% of retirees with such plans will lose the coverage.

In addition, millions of seniors will pay higher premiums for their Medicare (Part D) drug plan because of the cost of closing the "doughnut hole." Expect your <u>premiums to rise</u> by 4% in 2011 and by 9% in 2019.

What If I Am an Immigrant?

If you are a legal resident alien you will be required to obtain the same government mandated health coverage that U.S. citizens must obtain. However, if you have been here for less than five years, and if your income falls below 133% of the federal poverty level, you will not be allowed to enroll in Medicaid. Instead, you will be able to do something low-income U.S. citizens cannot do: obtain highly subsidized insurance (paying a premium, say, of ten cents on the dollar) in a health insurance exchange. If, as we expect, Medicaid insurance is lower-quality insurance, you will have access to better insurance than a U.S. citizen with the same income!

If you are an undocumented immigrant you will not be subject to the individual insurance mandates and you will not be fined if you fail to purchase health insurance. Nor will you be allowed to enroll in Medicaid or buy insurance in the health insurance exchange.

However, hospital emergency rooms will not be able to deny you health care if you are in need. What makes this surprising is that the most common argument for an individual mandate is that the uninsured should have to contribute to their own health care instead of getting it for free in the emergency room. This is why U.S. citizens will be required to pay hefty fines if they do not obtain insurance. If you are here illegally, however, you're an exception to this rule.

What If I Am a Doctor?

On the plus side, as many as 34 million uninsured people are expected to gain health coverage by 2014 and about half will have private insurance. Some physicians may find they can opt to treat more privately insured patients (paying higher fees) by reducing the number of Medicaid and Medicare patients they see.

There are two caveats, however. First, if poor and elderly patients find it increasingly difficult to see doctors, the government will probably be forced to make major changes in the law — perhaps even forcing you to accept an "all-payer" system, where the <u>fee will be the same for all patients</u>. Second, in Massachusetts the subsidized plans sold in the health insurance exchange pay physicians only 10% above Medicaid rates — and that is far below what private insurers pay.

Another plus if you are seeing Medicaid patients: The law provides that Medicaid fees will be raised to Medicare levels in 2013 and 2014 for primary care (but not for specialists!). Unfortunately, the fees are likely to go back to their old level in 2015.

The biggest near-term uncertainty is how much you will be paid by Medicare. A planned 21.5% Medicare fee cut that was scheduled to take effect in 2010 (due to the Sustainable Growth Rate formula) has been delayed until November, when Congress is likely to revisit the issue again.

A new Medicare Independent Payment Advisory Board (IPAB) will have the authority to fasttrack changes in Medicare payment rates in order to <u>reduce the growth of Medicare spending</u>. Similar to the sustainable growth formula, future cuts in Medicare will likely target doctors. The reason? All other methods of cost control are prohibited in the legislation. The IPAB's proposals may not "ration health care, raise revenues or Medicare beneficiary premiums, increase Medicare beneficiary cost-sharing (including deductibles, coinsurance, and copayments), or otherwise restrict benefits or modify eligibility criteria."

These spending reductions will begin to be implemented in 2015, although reductions in hospital payments will not begin until 2020. Also, the IPAB's decisions will not need Congressional approval. Congress can only block the decisions, and even then it can only do so by substituting a Congressional plan that saves more money than the IPAB plan.

The biggest long-term uncertainty is how much Medicare will interfere with the practice of medicine. Almost certainly the Medicare payment system will be used to promote electronic medical records, coordinated care, managed care, integrated care and bundled care. At the extreme, you may be pushed into an ACO, which is an HMO-type practice with conditional fees based on a checklist of performance measures. You will be paid more if you conform; less

if you don't conform — even if the end result is not good for patients. Expect private insurers to piggyback on Medicare's initiatives.

There is also a new moratorium on additional physician-owned specialty hospitals, despite evidence that these facilities <u>lower costs and raise quality</u>.

What Happened to the Public Plan Option?

It may not be gone. Early proponents of health reform wanted a government-run "public plan" to compete against private insurance. Opponents of a public plan option feared that if such a plan had the power to ignore rules private insurers must follow and could pay below-market Medicare reimbursement rates, it would put private insurers out of business. <u>The Lewin Group</u> estimated that under the most liberal scenario, where enrollment was open to all and doctors were paid fees similar to Medicare, an estimated 131 million people might join — of which 119 million would have <u>dropped private coverage</u>.

The public plan option was removed from the Patient Protection and Affordable Care Act. But a Senate amendment established a way to create government-run plans by another means. The federal health law will allow the U.S. Office of Personnel Management (OPM) to create multistate health plans that compete with private plans sold in the state-based exchanges. (OPM is the agency that runs the federal civil service.) These plans would enjoy the protection of a strong federal bureaucracy that conceivably could put private plans at a competitive disadvantage — possibly running your preferred plan out of business.

Is the New Long-Term Care Insurance a Good Deal?

A new federal program for long-term care, called the Community Living Assistance Services and Supports (CLASS) Act, will provide benefits to you if you become functionally disabled and are unable to perform such daily living activities as eating or bathing. The CLASS program will pay some of the costs of an aide at home or some of the costs of nursing home care. This program is voluntary. However, your employer has the option to automatically enroll you and to deduct the premiums from your paycheck, although you will be allowed to opt out. If you work for nonparticipating employers, you will have the option to enroll individually.

Is CLASS Act insurance a good deal? If you are healthy, you can probably get better insurance for less money elsewhere. Because the premium will be the same regardless of your expected costs, if you are healthy, you will pay higher premiums than are actuarially fair, while those who are more likely to need benefits due to chronic conditions or unhealthy habits will pay less. As a result, the program can be expected to disproportionately attract high-risk participants while

low-risk individuals will likely opt out. Since the program is supposed to be self-supporting, enrollees could face benefit cuts or increased premiums as the program becomes increasingly insolvent. According to the <u>Medicare chief actuary</u>, the program faces "a significant risk of failure" because the high costs will attract sicker people and lead to low participation.

How Can Health Reform Be Made Better?

Some critics advocate complete repeal of the reform law, followed by a better set of reforms. Others envision reforming the law. Regardless of the approach taken, here are 10 steps to better health care reform:

 Establish Equality Under the Law. During the evolution of the Affordable Care Act through the U.S. Congress, a number of special deals were made, including the "Louisiana Purchase," Florida's "Gator-aid," the "Cornhusker Kickback," special tax breaks for longshoremen and other union workers and less generous treatment of construction companies that compete against union workers. While many of these deals were removed in the final reconciliation bill they could reemerge in the future, and others, including the "Louisiana Purchase," remain in the current legislation.

Treat every Medicare enrollee the same. There should be no special class of Medicare eligibility in Montana, while millions of elderly and disabled citizens are losing benefits in other places. Nor should there be special Medicare payments for hospitals in Michigan, Connecticut and other states that are not available in other places where Medicare patients seek care.

Treat every Medicaid enrollee the same. There should be no special deals for Louisiana, Hawaii and other favored states, while everyone else has to pay their own way.

Treat every taxpayer the same. There should be no tax on some workers, while exempting others because they happen to be members of unions.

2. Drop Individual and Employer Mandates. We should not require people to buy something they cannot afford and then fine them when they don't buy it. Further, we should not have a wildly erratic system of subsidies that penalize and reward people, depending on where they work or where they buy insurance.

Replace the mandates with a fair and efficient system of economic incentives. We should provide generous financial support through the federal tax system to make health insurance affordable for every American.

Give all insurance the same subsidy — *regardless of where it is purchased.* We should treat all insurance the same — whether it is provided through an employer, purchased in the marketplace or acquired in a health insurance exchange.

Give every individual the same subsidy — *regardless of how insurance is obtained.* We should treat all individuals at the same income level the same — regardless of where they obtain their insurance. (See "Level the Playing Field for U.S. Health Insurance.")

- 3. Encourage Comprehensive Coverage for Seniors. We should encourage rather than discourage Medicare Advantage plans, which give seniors access to the type of broad comprehensive coverage most nonseniors have. We should encourage, rather than tax, employers' supplemental Medicare benefits.
- 4. Allow Health Insurance to Be Sold Across State Lines. We should encourage a national market for health insurance, allowing the citizens of each state access to the types of products routinely sold in the other 49 states. (See "<u>How to Create a</u> <u>Competitive Insurance Market</u>.")
- 5. Encourage Personal and Portable Insurance. We should end the current practice of barring employers from purchasing the type of insurance employees most want and need: insurance they own and can take with them as they go from job to job and in and out of the labor market. (See "Personal and Portable Health Insurance.")
- 6. Allow Private Insurance Alternatives to Medicaid and S-CHIP. Instead of trapping more children and families in public health plans that all too often ration care by waiting we should make those dollars available to subsidize private coverage, which gives patients access to the full range of medical providers and facilities. (See "Opportunities for State Medicaid Reform.")
- 7. Allow Special Health Savings Accounts for the Chronically III. One of the most successful Medicaid pilot programs is Cash and Counseling, under which the homebound and disabled manage their own budget and are free to hire and fire those who provide them with services. We should use this experience as a model to liberate the chronically ill and empower them in a newly-competitive medical marketplace. (See Health Alert on chronic illness and health savings accounts.)
- 8. Allow Health Insurance Plans to Specialize in Solving the Problems of the Chronically III. Instead of requiring health plans to treat all enrollees as though they were the same, we should encourage special needs plans that specialize in treating the health problems of the chronically ill by providing them with premiums that match the expected cost of care. (See Health Alert on chronic illness and health savings accounts.)

- **9.** Allow Employers and Their Employees to Prefund Postretirement Health Care. Although one-third of baby boomer workers have an employer promise of postretirement health care, almost none of these promises have been funded. We should allow employers to help their retirees obtain personally-owned, portable insurance for their retirees and to build up funds in order to keep their promises. (See Health Alert, "What to Do About Early Retirees.")
- 10. Enact Sensible Malpractice Reform. Encourage a health care system in which victims of unexpected adverse events are promptly compensated by episode-specific insurance, and in which providers and facilities have economic incentives to reduce medical errors without the need of lawyers, judges, jurors and courthouses. (See "Five Steps to Liability by Contract.")

For 27 years, the National Center for Policy Analysis has worked to research and aggressively market private sector solutions to the media, general public and policymakers in Washington. They bring together the best and brightest minds to tackle the country's most difficult public policy problems to reform institutions in the areas of health care, Social Security, tax, retirement, the economy, small business, and energy and the environment by proposing reforms that liberate consumers, workers, entrepreneurs and the power of the marketplace.
